

Kodschul - Agent Knowledge Source

Purpose: concise grounding document for a Microsoft Foundry knowledge agent. Content is based on public Kodschul pages reviewed on 1 October 2026.

Company overview

- Kodschul provides practice-oriented IT and AI training for companies, institutions, students, and professionals. The training model emphasizes direct application rather than theory-only teaching.
- Kodschul positions its seminars around practical enablement: participants work with real tools and concrete tasks so that what they build or learn can be reused directly in daily work.
- Kodschul offers training online and on-site, including standard seminars, customized in-house workshops, and AI hackathons.

Training methodology

- The standard training format is strongly hands-on, with approximately 70% practice and 30% theory.
- Typical seminar size is around 8 to 12 participants, with many practical workshops lasting 1 to 2 days.
- The usual flow is: align participants on the fundamentals, introduce the topic with demonstrations and examples, let participants practice independently, then apply the learning to concrete business use cases.
- For custom workshops, content, examples, pace, and exercises are adapted to the company, participant level, and real internal tasks.

Main training areas

- AI for users: ChatGPT, Claude, Microsoft Copilot, AI video and avatars, local LLMs, data security, and prompt-based workflows.
- AI for developers: GitHub Copilot, Claude Code, AI tools in software development, n8n, Power Automate, Copilot Studio, Python, data science, machine learning, and AI agents.
- IT transformation: Docker, Kubernetes, Azure, React, Next.js, Angular, JavaScript, TypeScript, Git, DevOps, CI/CD, Rust, and cyber security.

AI agent and automation focus

- Kodschul teaches organizations how to build and use AI agents and automations in practical workflows.
- Examples described publicly include agent-based automation for training departments, sales operations, document analysis, email handling, calendar management, contact maintenance, and internal workflows.
- For developer teams, Kodschul also covers agentic AI, MCP, Python-based agents, Copilot Studio, and automation platforms such as n8n and Power Automate.

Example business outcomes

- In a training-department use case, AI agents were used for reasoning rules, forwarding work to partners and colleagues, email delivery, document analysis, and image processing.
- In a sales use case, AI agents were used to manage calendars, prioritize and answer emails, and maintain contacts, reducing manual administrative work.

- In a product-management use case, AI tools were applied to emails, documents, Copilot, and prompting, including automation of repetitive reminder tasks.
- In developer-team use cases, AI coding assistants can be configured to respect internal development standards, code quality expectations, security requirements, and company guidelines.

How a Kods Schul knowledge agent should answer

- Answer questions about Kods Schul training formats, methodology, course areas, AI/IT topics, and practical business use cases using this document as the source of truth.
- Do not invent course dates, prices, trainer availability, customer contracts, or private company information that is not present in the knowledge source.
- If a user asks for information not contained here, state that the current knowledge source does not provide enough information.
- When useful, explain answers in practical terms and connect a topic to realistic company scenarios.

Suggested agent test questions

- What is Kods Schul's training methodology?
- What is the difference between a standard seminar and an in-house workshop?
- Which AI topics does Kods Schul teach developers?
- How can AI agents help a sales team in a real company?
- What role do MCP and AI agents play in Kods Schul developer training?
- How much of a typical Kods Schul training is practical work?
